## Properties off <br> Artinim If Irumetions

## Copy from Lang, Algebraic Number Theory

1) $\mathbf{L}(\mathbf{u}, \mathbf{1}, \mathbf{Y} / \mathbf{X})=\zeta(\mathbf{u}, \mathbf{X})$
$=$ Ihara zeta function of $\mathbf{X}$
(our analogue of the Dedekind zeta function, also Selberg zeta function)
2) 

$$
\zeta(u, Y)=\prod_{\rho \in \hat{G}} L(u, \rho, Y / X)^{d_{\rho}}
$$

product over all irred. reps of $\mathbf{G}$,
$d_{\rho}=$ degree $\rho$
3) You can prove $\zeta(\mathbf{u}, \mathbf{X})^{-1}$ divides $\zeta(\mathbf{u}, \mathbf{Y})^{-1}$ directly and you don't need to assume Y/X Galois.

Thus the analog of the Dedekind conjecture for zetas of algebraic number fields is proved easily for graph zetas.

## Ihara Theorem for LL=Fumctions

$L(u, \rho, Y / X)^{-1}$
$=\left(1-u^{2}\right)^{(r-1) d_{\rho}} \operatorname{det}\left(I^{\prime}-A_{\rho}^{\prime} u+Q^{\prime} u^{2}\right)$
$r=$ rank fundamental group of $\mathrm{X}=|\mathrm{E}|-|\mathrm{V}|+\mathbf{1}$ $\rho=\operatorname{representation~of~} \mathbf{G}=\mathbf{G a l}(\mathbf{Y} / \mathbf{X}), \mathbf{d}=\mathbf{d}_{\rho}=$ degree $\rho$

Definitions. nd $\times$ nd matrices $\mathbf{A}^{\prime}, \mathbf{Q}^{\prime}, \mathbf{I}^{\prime}, \mathbf{n}=|\mathbf{X}|$ nxn matrix $A(g), \mathbf{g} \in \mathbf{G a l}(\mathbf{Y} / \mathbf{X})$, has entry for $\alpha, \beta \in X$ given by $(\mathbf{A}(\mathrm{g}))_{\alpha, \beta}=\#$ \{ edges in Y from ( $\alpha, \mathrm{e}$ ) to $\left.(\beta, \mathrm{g})\right\}$ Here e=identity of $\mathbf{G}$.

$$
A_{\rho}^{\prime}=\sum_{g \in G} A(g) \otimes \rho(g)
$$

$Q=$ diagonal matrix, jth diagonal entry $=q_{j}=($ degree of $j$ th vertex in $X)-1$,
$\mathbf{Q}^{\prime}=\mathbf{Q} \otimes \mathbf{I}_{\mathrm{d}}$,
$\mathbf{I}^{\prime}=\mathbf{I}_{\mathrm{nd}}=$ identity matrix.

Proof can be found in Stark and Terras, Advances in Math., Vol. 154 (2000)

## NOTES FOR REGULAR GRAPHS mostly

Another proof uses Selberg trace formula on tree to prove Ihara's theorem. For case of trivial representation, see A.T., Fourier Analysis on Finite Groups \& Applics; for general case, see and Venkov \& Nikitin, St. Petersberg Math. J., 5 (1994)
$4\left(\frac{1}{\zeta_{X}}\right)^{(r)}(0)=(-1)^{r+1} 2^{r}(r-1) \kappa(X)$, where $\kappa(X)=$ the number of spanning trees of $\mathbf{X}$, the complexity

Ihara zeta has functional equations relating value at $\mathbf{u}$ and $\mathbf{1 / ( q u ) , ~} \mathbf{q}=$ degree - $\mathbf{1}$

Riemann Hypothesis, for case of trivial representation (poles), means graph is Ramanujan i.e., non-trivial spectrum of adjacency matrix is contained in the spectrum for the universal covering tree which is the interval ( $-2 \sqrt{ } \mathbf{q}, 2 \sqrt{ }$ ) [see Lubotzky, Phillips \& Sarnak, Combinatorica, 8 (1988)]

RH is true for most graphs but it can be false
*Hashimoto [Adv. Stud. Pure Math., 15 (1989)] proves Ihara $\zeta$ for certain graphs is essentially the $\zeta$ function of a Shimura curve over a finite field

## The Prime Number Theorem

\& \& \& \& \& \& \& \& \& \& \& \& \& \& \& \& \& \& \& \& \& \& Let $\pi_{\mathrm{x}}(\mathrm{m})$ denote the number of prime path equivalence classes [ $C$ ] in $X$ where the length of $C$ is $\mathbf{m}$. Assume $\mathbf{X}$ is finite connected ( $\mathbf{q}+1$ )-regular. Since $1 / q$ is the absolute value of the closest pole(s) of $\zeta(u, X)$ to 0 , then

$$
\pi_{\mathbf{x}}(\mathbf{m}) \sim \mathbf{q}^{\mathbf{m} / \mathbf{m} \text { as } \mathbf{m} \rightarrow \infty . . . . ~}
$$ \& \& \& \& \& \& \& \& \& \& \& \& \& \& \& \& \& \& The proof comes from the method of generating functions (See Wilf, generatingfunctionology) and the fact that (as in Stark \& Terras, Advances in Math, 121 \& 154):

$$
u \frac{d}{d u} \log \zeta(u, X)=\sum_{m=1}^{\infty} n_{X}(m) u^{m}
$$

Here $n_{X}(m)$ is the number of closed paths $C$ in $X$ of length $m$ without backtracking or tails.
 Note: When $X$ is not regular, we could define $q$ to be the reciprocal of the absolute value of the closest pole(s) of zeta to 0 .

## EXAMPLE 1. $Y=$ cube, $X=$ tetrahedron

$$
|\mathrm{X}|=4, \quad|\mathrm{Y}|=8, \quad \mathbf{r}=3, \quad \mathbf{G}=\{\mathrm{e}, \mathrm{~g}\}
$$

representations of $G$ are 1 and $\rho: \rho(\mathbf{e})=1, \rho(\mathbf{g})=-1$

$$
\mathbf{I}^{\prime}=\mathbf{I}_{\mathbf{4}}, \mathbf{Q}^{\prime}=\mathbf{2} \mathbf{I}_{\mathbf{4}},
$$

$A(e)_{u, v}=\#\left\{\right.$ length 1 paths $\mathbf{u}^{\prime}$ to $\mathbf{v}^{\prime}$ in $\left.\mathbf{Y}\right\}$
$A(g)_{u, v}=\#\left\{\right.$ length 1 paths $u^{\prime}$ to $v^{\prime \prime}$ in $\left.Y\right\}$

$$
A(e)=\left(\begin{array}{llll}
0 & 1 & 0 & 0 \\
1 & 0 & 1 & 1 \\
0 & 1 & 0 & 0 \\
0 & 1 & 0 & 0
\end{array}\right) \quad A(g)=\left(\begin{array}{llll}
0 & 0 & 1 & 1 \\
0 & 0 & 0 & 0 \\
1 & 0 & 0 & 1 \\
1 & 0 & 1 & 0
\end{array}\right)
$$

$\mathrm{A}^{\prime}{ }_{1}=\mathbf{A}=$ adjacency matrix of $\mathbf{X}$

$$
A_{\rho}^{\prime}=A(e)-A(g)=\left(\begin{array}{cccc}
0 & 1 & -1 & -1 \\
1 & 0 & 1 & 1 \\
-1 & 1 & 0 & -1 \\
-1 & 1 & -1 & 0
\end{array}\right)
$$

# Ieta and L－Functions of Cube Tetrahedron 

类 $\zeta(\mathbf{u}, \mathbf{Y})^{-1}=\mathbf{L}(\mathbf{u}, \rho, \mathbf{Y} / \mathbf{X})^{-1} \zeta(\mathbf{u}, \mathbf{X})^{-1}$
测 $\mathrm{L}(\mathrm{u}, \rho, \mathrm{Y} / \mathrm{X})^{-1}=\left(1-\mathrm{u}^{2}\right)(1+\mathrm{u})(1+2 \mathrm{u})\left(1-u+2 \mathrm{u}^{2}\right)^{3}$
资 $\zeta(u, X)^{-1}=\left(1-u^{2}\right)^{2}(1-u)(1-2 u)\left(1+u+2 u^{2}\right)^{3}$
准 roots of $\zeta(\mathbf{u}, \mathbf{X})^{-1}$ are $1,1,1,1 / 2, \mathbf{r}, \mathbf{r}, \mathbf{r}$
where $r=(-1 \pm \sqrt{ }-7) / 4$ and $|r|=1 / \sqrt{ } 2$
＊The pole of $\zeta(\mathbf{u}, \mathrm{X})$ closest to 0 governs the prime number theorem discussed a few pages back．It is $\mathbf{1 / q = 1 / 2}$ ．The coefficients of the following generating function are the numbers of closed paths without backtracking or tails of the indicated length

$$
u \frac{d}{d u} \log \zeta(u, X)=24 u^{3}+24 u^{4}+96 u^{6}+168 u^{7}+168 u^{8}+528 u^{9}+1200 u^{10}+1848 u^{11}+O\left(u^{12}\right)
$$

So there are 8 primes of length $\mathbf{3}$ in $X$ ，for example．

$$
\begin{gathered}
G=S_{3}, H=\{(1),(23)\} \text { fixes } Y_{3} \cdot a^{(1)}=(a,(1)), a^{(2)}=(a,(13)), a^{(3)}=(a,(132), \\
a^{(4)}=(a,(23)), a^{(5)}=(a,(123)), a^{(6)}=(a,(23))
\end{gathered}
$$

Here we use the standard cycle notation for elements of the symmetric group.

## 3 classes of primes

 in base graph $X$ from preceding
page

* Class C1 path in $X$ (list vertices) 14312412431
$f=1, g=3 \quad 3$ lifts to $Y_{3}$
1'4'3"'1"2"'4"1"2"4"'3'1'
1"4"3"1"2"4"'1"2"'4"3"1"
$1^{\prime \prime \prime} 4^{\prime \prime \prime} 3^{\prime} 1^{\prime} 2^{\prime} 4^{\prime} 1^{\prime}$ ' $^{\prime} 4^{\prime} 3^{\prime \prime \prime} 1^{\prime \prime \prime}$
Frobenius trivial $\Rightarrow$ density $1 / 6$
* Class C2 path in X (list vertices) 1241 2 lifts to $Y_{3}$
1'2'4'1' $\quad f=1$
1"2"4"'1"2"'4"1" f=2
Frobenius order $2 \Rightarrow$ density $1 / 2$
* Class C3 path in X (list vertices)

12431
$f=3 \quad 1$ lift to $Y_{3}$
1'2'4'3""1"'2"'4"3"1"2"4"'3'1'
Frobenius order $3 \Rightarrow$ density $1 / 3$

( $\zeta(\mathrm{u}, \mathrm{X})^{-1}=\left(1-\mathrm{u}^{2}\right)(1-u)\left(1+\mathbf{u}^{2}\right)\left(1+u+2 u^{2}\right)\left(1-u^{2}-2 u^{3}\right)$

$$
\begin{aligned}
& \zeta\left(\mathbf{u}, \mathbf{Y}_{3}\right)^{-1}=\zeta(\mathbf{u}, \mathbf{X})^{-1}\left(1-\mathbf{u}^{2}\right)^{2}\left(1-\mathbf{u}-\mathbf{u}^{3}+2 \mathbf{u}^{4}\right) \\
& \times\left(1-\mathbf{u}+2 \mathbf{u}^{2}-\mathbf{u}^{3}+2 \mathbf{u}^{4}\right)\left(1+\mathbf{u}+\mathbf{u}^{3}+2 \mathbf{u}^{4}\right) \\
& \times\left(\mathbf{1}+\mathbf{u}+2 \mathbf{u}^{2}+\mathbf{u}^{3}+2 \mathbf{u}^{4}\right)
\end{aligned}
$$

$\zeta\left(\mathbf{u}, \mathbf{Y}_{6}\right)^{-1}=\zeta\left(\mathbf{u}, \mathbf{Y}_{3}\right)^{-1}\left(1-\mathbf{u}^{2}\right)^{8}(1+\mathbf{u})\left(1+\mathbf{u}^{2}\right)\left(1-u+2 \mathbf{u}^{2}\right)$

$$
\begin{aligned}
& \times\left(1-u^{2}+2 u^{3}\right)\left(1-u-u^{3}+2 u^{4}\right)\left(1-u+2 u^{2}-u^{3}+2 u^{4}\right) \\
& \times\left(1+u+u^{3}+2 u^{4}\right)\left(1+u+2 u^{2}+u^{3}+2 u^{4}\right)
\end{aligned}
$$

It follows that, as in the number theory analog,

$$
\zeta(\mathbf{u}, \mathbf{X})^{2} \zeta\left(\mathbf{u}, \mathbf{Y}_{6}\right)=\zeta\left(\mathbf{u}, \mathbf{Y}_{2}\right) \zeta\left(\mathbf{u}, \mathbf{Y}_{3}\right)^{2}
$$

Here $Y_{2}$ is an intermediate quadratic extension between $\mathrm{Y}_{6}$ and X. See Stark and Terras, Adv. in Math., 154 (2000), Figure 13, for a discussion.

The poles of $\zeta(\mathbf{u}, \mathbf{X})$ are $\mathbf{u}=\mathbf{1 , 1 , - 1 ,} \mathbf{i},(-1 \pm \sqrt{7} \mathbf{i} / 4, \mathbf{w}, \mathbf{w}, \mathbf{1} / \mathbf{q}$ Where $\mathbf{w , 1 / q}$ are roots of the cubic. The closest pole to 0 is $\mathbf{1 / q}$. And $q$ is approximately $\mathbf{1 . 5 2 1 4}$. So the prime number theorem gives a considerably smaller main term, $q^{m} / \mathrm{m}$, for this graph $X$ than for $\mathbf{K}_{\mathbf{4}}$, where $\mathbf{q}=\mathbf{2}$.

Orient the edges of the graph. Multiedge matrix $\mathbf{W}$ has ab entry $w(a, b)=w_{a b}$ in $C$, if the edges a and $b$ look like

## a b

Otherwise set $w_{a b}=0 \quad$ Define for closed path $C=a_{1} a_{2} \ldots a_{s}$,

$$
\mathbf{N}_{E}(C)=w\left(\mathbf{a}_{s}, \mathbf{a}_{1}\right) w\left(\mathbf{a}_{1}, \mathbf{a}_{2}\right) \ldots w\left(\mathbf{a}_{s-1}, \mathbf{a}_{s}\right)
$$

$$
L_{E}(W, \rho, Y / X)=\prod_{[C]}\left(1-\rho\left(\frac{Y / X}{D}\right) N_{E}(C)\right)^{-1}
$$

where the product is over primes [C] of $X$ and [D] is any prime of Y over [C]

## Properties

$>\mathrm{L}_{\mathrm{E}}(\mathrm{W}, 1, \mathrm{Y} / \mathrm{X})=\zeta_{\mathrm{E}}(\mathbf{W}, \mathrm{X})$, the edge zeta function
$>\mathrm{L}_{\mathrm{E}}(\mathbf{W}, \rho)^{-1}=\operatorname{det}\left(\mathrm{I}-\mathbf{W}_{\rho}\right)$, where $\mathbf{W}_{\rho}$ is a $2|\mathrm{E}| \mathbf{x} 2|\mathrm{E}|$ block matrix with ij block given by $\left(\mathrm{w}_{\mathrm{ij}} \rho\left(\operatorname{Frob}\left(\mathrm{e}_{\mathrm{i}}\right)\right)\right.$
$>$ Induction property
> Factorization of edge zeta as a product of edge Lfunctions
$>$ specialize all wij=u and get the Artin-Ihara vertex $L$ function

## EXAMPLE.

## X=Dumbbell Graph and Fission of an Edge

Here $b$ and $e$ are the vertical edges.
Specialize all variables with $b$ and $e$ to be 0 and get zeta function of subgraph with vertical edge removed - Fision This gives the graph with just 2 disconnected loops.

## Example 3 culb Covering Dumblell

Y=Cube $a^{(3)}$

$a^{(4)}$

## X=Dumbbell

$\operatorname{Gal}(\mathrm{Y} / \mathrm{X})=\left\{\sigma_{1}, \sigma_{2}, \sigma_{3}, \sigma_{4}\right\} \approx \mathrm{Z} / 4 \mathrm{Z}$. Identification sends $\quad \sigma_{j}$ to $\mathrm{j}-1(\bmod 4)$
The representations are 1 -dimensional: $\pi_{\mathrm{a}}(\mathrm{b})=\mathrm{i}^{\mathrm{a}(\mathrm{b}-1)}$. Galois group elements associated to edges $\mathrm{a}, \mathrm{b}, \mathrm{c}$ are $\operatorname{Frob}(a)=\sigma_{2}, \quad \operatorname{Frob}(b)=\sigma_{1}, \quad \operatorname{Frob}(c)=\sigma_{2}$.

Edge LFFunctions for Exanple 3.

$$
\zeta(W, X)^{-1}=L(W, 1, Y / X)^{-1}=\operatorname{det}\left(\begin{array}{cccccc}
w_{c a}-1 & w_{a b} & 0 & 0 & 0 & 0 \\
0 & -1 & w_{b c} & 0 & 0 & w_{b f} \\
0 & 0 & w_{c c}-1 & 0 & w_{c e} & 0 \\
0 & w_{d b} & 0 & w_{d d}-1 & 0 & 0 \\
w_{c a} & 0 & 0 & w_{e d} & -1 & 0 \\
0 & 0 & 0 & 0 & w_{f e} & w_{f f}-1
\end{array}\right)
$$

$$
L_{E}\left(W, \pi_{1}, Y / X\right)^{-1}=\operatorname{det}\left(\begin{array}{cccccc}
i w_{c a}-1 & i w_{a b} & 0 & 0 & 0 & 0 \\
0 & -1 & w_{b c} & 0 & 0 & w_{b f} \\
0 & 0 & i w_{c}-1 & 0 & i w_{c e} & 0 \\
0 & -i w_{d b} & 0 & -i w_{d d}-1 & 0 & 0 \\
w_{e a} & 0 & 0 & w_{c d} & -1 & 0 \\
0 & 0 & 0 & 0 & -i w_{f e} & -i w_{f f}-1
\end{array}\right)
$$

$$
L\left(W, \pi_{2}, Y / X\right)^{-1}=\operatorname{det}\left(\begin{array}{cccccc}
-w_{a a}-1 & -w_{c b} & 0 & 0 & 0 & 0 \\
0 & -1 & w_{b c} & 0 & 0 & w_{b f} \\
0 & 0 & -w_{c}-1 & 0 & -w_{c e} & 0 \\
0 & -w_{d b} & 0 & -w_{d d}-1 & 0 & 0 \\
w_{e a} & 0 & 0 & w_{e d} & -1 & 0 \\
0 & 0 & 0 & 0 & -w_{f e} & -w_{f f}-1
\end{array}\right)
$$

$$
L\left(W, \pi_{3}, Y / X\right)^{-1}=\operatorname{det}\left(\begin{array}{cccccc}
-i w_{a a}-1 & -i w_{a b} & 0 & 0 & 0 & 0 \\
0 & -1 & w_{b c} & 0 & 0 & w_{b f} \\
0 & 0 & -i w_{c c}-1 & 0 & -i w_{c e} & 0 \\
0 & i w_{d b} & 0 & i w_{d d}-1 & 0 & 0 \\
w_{e a} & 0 & 0 & w_{e d} & -1 & 0 \\
0 & 0 & 0 & 0 & i w_{f e} & i w_{f f}-1
\end{array}\right)
$$

Note that the product of these $6 \times 6$ determinants is the $24 \times 24$ determinant whose reciprocal is the multiedge zeta function of Y , the cube.

## Pog tin Lexnctions

Here we discuss a new kind of L-function with smaller sized matrix determinants.

Fundamental Group of X can be identified with group generated by edges left out of a spanning tree

$$
e_{1}, \ldots e_{r}, e_{1}^{-1}, \ldots, e_{r}^{-1}
$$

$2 \mathrm{r} \times 2 \mathrm{r}$ multipath matrix Z has ij entry
$\mathrm{z}_{\mathrm{ij}}$ in C if $e_{j} \neq e_{i}^{-1}$ and $\mathrm{Z}_{\mathrm{ij}}=0$, otherwise.

Imitate the definition of the edge Artin L-functions.
Write a prime path as a reduced word in a conjugacy class

$$
C=a_{1} \cdots a_{s} \text {, where } a_{j} \in\left\{e_{1}^{ \pm 1}, \ldots, e_{r}^{ \pm 1}\right\}
$$

and define the path norm

$$
\begin{gathered}
N_{P}(C)=z\left(a_{s}, a_{1}\right) \prod_{i=1}^{s-1} z\left(a_{i}, a_{i+1}\right) \\
\quad \text { where } \mathrm{z}\left(\mathrm{e}_{\mathrm{i}}, \mathrm{e}_{\mathrm{j}}\right)=\mathrm{z}_{\mathrm{ij}} .
\end{gathered}
$$

Define the path zeta L-function

$$
L_{P}(Z, \pi, Y / X)=\prod_{[C]} \operatorname{det}\left(1-\pi\left(\frac{Y / X}{D}\right) N_{P}(C)\right)^{-1}
$$

Product is over prime cycles [C] in X
[D] is any prime of Y over [C]

## 

The path L－functions have analogous properties to the edge L－functions．
类 They are reciprocals of polynomials．
类 They provide factorizations of the path zeta functions．法 The most important property is that of

## Specialization to Path L－functions．

$>$ edges left out of a spanning tree T of $\mathrm{X}: \quad e_{1}, \ldots e_{r}$ generate fundamental group of X
$>$ inverse edges are $e_{r+1}=e_{1}^{-1}, \ldots, e_{2 r}=e_{r}^{-1}$
$>$ edges of the spanning tree T are $t_{1}, \ldots, t_{|X|-1}$
$>$ with inverse edges $t_{|X|}, \ldots t_{2|X|-2}$
If $e_{i} \neq e_{j}^{-1}$ ，write the part of the path between $\mathrm{e}_{\mathrm{i}}$ and $\mathrm{e}_{\mathrm{j}}$ as the（unique）product $t_{k_{1}} \cdots t_{k_{n}}$
C is 1 st a product of $\mathrm{e}_{\mathrm{j}}$（generators of the fundamental group），then a product of actual edges $e_{j}$ and $t_{k}$ ． Specialize the multipath matrix Z to $\mathrm{Z}(\mathrm{W})$ with entries

$$
z_{i j}=w\left(e_{i}, t_{k_{1}}\right) w\left(t_{k_{n}}, e_{j}\right) \prod_{v=1}^{n-1} w\left(t_{k_{k}}, t_{k_{k+1}}\right)
$$

Then

$$
L_{P}(Z(W), X)=L_{E}(W, X)
$$

## Example - the Dumbbell

Recall the edge zeta
was a $6 \times 6$ determinant.
The specialized path zeta is only $4 x 4$.
Maple computes it much faster than the
 $6 \times 6$.

$$
\zeta_{E}(W, X)^{-1}=\operatorname{det}\left(\begin{array}{cccc}
w_{a a}-1 & w_{a b} w_{b c} & 0 & w_{a b} w_{b f} \\
w_{c e} w_{e a} & w_{c c}-1 & w_{c e} w_{e d} & 0 \\
0 & w_{d b} w_{b c} & w_{d d}-1 & w_{d b} w_{b f} \\
w_{f e} w_{e a} & 0 & w_{f e} w_{e d} & w_{f f}-1
\end{array}\right)
$$

Fusion of an edge is now easy to do in the path zeta.

To obtain edge zeta of graph obtained from dumbbell graph, by fusing edges $b$ and $e$,

Replace $\mathbf{w}_{\mathbf{x b}} \mathbf{W}_{\text {by }}$ with $\mathbf{w}_{\mathbf{x y}}$ Replace $\mathbf{w}_{\mathrm{xe}} \mathbf{W}_{\mathrm{ey}}$ with $\mathbf{w}_{\mathrm{xy}}$

## Application of Galois Theory of Graph

 Coverings. You can't hear the shape of a graph.Find 2 regular graphs (without loops and multiple edges) which are isospectral but not isomorphic.

See A.T. \& Stark in Adv. in Math., Vol. 154 (2000) for the details. The method goes back to algebraic number theorists who found number fields $K_{i}$ which are non isomorphic but have the same Dedekind zeta. See Perlis, J. Number Theory, 9 (1977).
