

Contents

Table of Contents	iii
Preface	ix
I Introduction	1
1 Display models	1
1.1 Rectangular arrays of pixels	2
1.2 Vector graphics	3
1.3 Polygonal modeling	4
2 Coordinates, points, lines and polygons	5
2.1 Coordinate systems	5
2.2 Geometric shapes in OpenGL	7
3 Double buffering for animation	18
II Transformations and Viewing	21
1 Transformations in 2-space	23
1.1 Basic definitions	24
1.2 Matrix representation of linear transformations	25
1.3 Rigid transformations and rotations	29
1.4 Homogeneous coordinates	32
1.5 Matrix representation of affine transformations	33
1.6 Two dimensional transformations in OpenGL	35
1.7 Another outlook on composing transformations	38
1.8 Two dimensional projective geometry	39
2 Transformations in 3-space	43
2.1 Moving from 2-space to 3-space	43
2.2 Transformation matrices in OpenGL	45
2.3 Derivation of the rotation matrix	50
2.4 Euler's theorem	54
2.5 Three dimensional projective geometry	56
3 Viewing transformations and perspective	57
3.1 Orthographic viewing transformations	59
3.2 Perspective transformations	60
3.3 Mapping lines to lines	65

3.4	Another use for projection: shadows	66
3.5	The OpenGL perspective transformations	67
4	Mapping to pixels	72
4.1	Bresenham algorithm	77
4.2	The perils of floating point roundoff	79
III	Lighting, Illumination, and Shading	83
1	The Phong lighting model	85
1.1	Diffuse reflection	88
1.2	Specular reflection	90
1.3	Ambient reflection and emissivity	93
1.4	Putting it together: Multiple lights and colors	93
1.5	Gouraud and Phong shading	94
1.6	Computing surface normals	97
1.7	Affine transformations and normal vectors	101
1.8	Light and material properties in OpenGL	103
2	The Cook-Torrance lighting model	108
2.1	Bidirectional reflectivity	109
2.2	Overview of Cook-Torrance	111
2.3	The microfacet distribution term	113
2.4	The geometric surface occlusion term	114
2.5	The Fresnel term	119
IV	Averaging and Interpolation	123
1	Linear interpolation	124
1.1	Interpolation between two points	124
1.2	Weighted averages and affine combinations	125
1.3	Interpolation on three points: barycentric coordinates	127
2	Bilinear and trilinear interpolation	133
2.1	Bilinear interpolation	133
2.2	Inverting bilinear interpolation	139
2.3	Trilinear interpolation	144
3	Convex sets and weighted averages	145
4	Interpolation and homogeneous coordinates	148
4.1	Weighted averages in homogeneous coordinates	148
5	Hyperbolic interpolation	150
6	Spherical linear interpolation	151
V	Texture Mapping	155
1	Texture mapping an image	155
1.1	Interpolating a texture to a surface	157
1.2	Assigning texture coordinates	158
1.3	Mipmapping and anti-aliasing	163
1.4	Stochastic supersampling	165
2	Bump mapping	167
3	Environment mapping	170

4	Texture mapping in OpenGL	172
4.1	Loading a texture map	172
4.2	Specifying texture coordinates	175
4.3	Modulating color	175
4.4	Separate specular highlights	176
4.5	Managing multiple texture maps	177
4.6	Environment mapping in OpenGL	178
VI	Color	181
1	Color perception	181
2	Representation of color values	184
2.1	Additive and subtractive colors	184
2.2	Representation of RGB colors	186
2.3	Hue, saturation and luminance	187
VII	Bézier Curves and B-Splines	193
1	Bézier curves	194
1.1	Bézier curves of degree three	194
1.2	De Casteljau's method	197
1.3	Recursive subdivision	198
1.4	Piecewise Bézier curves	203
1.5	Hermite polynomials	204
1.6	Bézier curves of general degree	205
1.7	De Casteljau method, revisited	209
1.8	Recursive subdivision, revisited	210
1.9	Degree elevation	212
2	Bézier surface patches	214
2.1	Basic properties of Bézier patches	214
2.2	Joining Bézier patches	217
3	Bézier curves and surfaces in OpenGL	220
3.1	Bézier curves	220
3.2	Bézier patches	222
4	B-splines	224
4.1	Uniform B-splines	224
4.2	Non-uniform B-splines	228
4.3	Examples of non-uniform B-splines	231
4.4	Properties of non-uniform B-splines	237
4.5	The de Boor algorithm	241
4.6	Blossoms	244
4.7	Derivatives and smoothness of B-spline curves	248
4.8	Rational splines and NURBS	251
4.9	Conic sections with rational curves	253
4.10	Knot insertion	260
4.11	Bézier and B-spline curves	263
4.12	Degree elevation	265
4.13	B-splines and NURBS surfaces in OpenGL	266

5	Interpolating with spline curves	266
5.1	Catmull-Rom splines	267
5.2	Bessel-Overhauser splines	269
5.3	Tension-continuity-bias splines	271
5.4	Interpolating with B-splines	274
6	Interpolating with Bézier surfaces	277
VIII	Ray Tracing	283
1	Basic ray tracing	284
1.1	Local lighting and reflection rays	289
1.2	Transmission rays	291
1.3	Putting it all together	295
2	Advanced ray tracing techniques	297
2.1	Distributed ray tracing	297
2.2	Backwards ray tracing	305
3	Special effects without ray tracing	307
IX	Intersection Testing	313
1	Fast intersections with rays	314
1.1	Ray versus sphere intersections	314
1.2	Ray versus plane intersections	317
1.3	Ray versus triangle intersections	319
1.4	Ray versus convex polytope intersections	321
1.5	Ray versus cylinder intersections	325
1.6	Ray versus quadric intersections	325
1.7	Ray versus Bézier patch intersections	326
2	Pruning intersection tests	327
X	Radiosity	333
1	The radiosity equations	335
1.1	Patches, light levels and form factors	335
1.2	High-level description of the radiosity algorithm	337
2	Calculation of form factors	339
2.1	The ray tracing method	341
2.2	The hemicube method	342
3	Solving the radiosity equations	345
3.1	Iterative methods	345
3.2	Jacobi iteration	349
3.3	Gauss-Seidel iteration	350
3.4	The shooting method	351
XI	Animation and Kinematics	353
1	Overview	353
1.1	Techniques evolved from traditional animation	354
1.2	Computerized animation	356
2	Animation of position	358

2.1	Ease in: fixed target	358
2.2	Ease in: moving target	359
3	Representations of orientations	360
3.1	Rotation matrices	361
3.2	Yaw, pitch and roll	362
3.3	Quaternions	364
3.4	Theoretical development of quaternions	365
3.5	Representing rotations with quaternions	368
3.6	Quaternion and rotation matrix conversions	370
3.7	Interpolation of quaternions	373
4	Kinematics	375
4.1	Rigid links and joints	375
4.2	Forward kinematics	376
4.3	Inverse kinematics, setting it up	379
4.4	Inverse kinematics, finding a local solution	382
A	Mathematics Background	389
1	Vectors and vector products	389
1.1	Vectors in \mathbb{R}^2	389
1.2	Vectors in \mathbb{R}^3	394
2	Matrices	396
2.1	Matrices and vector products in \mathbb{R}^3	397
2.2	Determinants, inverses and adjoints	398
3	Multivariable calculus	399
3.1	Multivariable functions	399
3.2	Vector-valued functions	401
3.3	Multivariable vector-valued functions	401
B	RayTrace Software Package	403
1	Introduction to the ray tracer package	403
2	The high-level ray tracing routines	405
3	The RayTrace API	408
3.1	Specifying lights	408
3.2	Defining the viewport and camera positions	410
3.3	Working with the pixel array	411
3.4	Defining materials	412
3.5	Defining viewable geometries	413
3.6	Viewable spheres	414
3.7	Viewable triangles and parallelograms	415
3.8	Viewable ellipsoids	416
3.9	Viewable cylinders	417
3.10	Viewable cones	418
3.11	Viewable parallelepipeds	420
3.12	Viewable tori	420
3.13	Viewable Bézier patches	421
3.14	Texture maps	424

Bibliography	429
Index	437
